Project Reference No.:	1117
Project Name:	Willamette Country Music Festival TIA Response to 4/6/18 Memorandum from James L. Buchal

The purpose of this memorandum is to provide a response to the memorandum from James L. Buchal of Murphy & Buchal, LLP dated April 6, 2018 in response to the February 20, 2018 Transportation Impact Analysis (TIA) submitted for the relocation of the Willamette Country Music Festival.

A Revised TIA was submitted on April 6, 2018 to ODOT and Marion County during the open record period providing additional information to respond to Marion County and ODOT comments on the February 20, 2018 TIA. This Revised TIA incorporates additional information from public outreach efforts, the addition of contingency routes to address potential incidents, and additional discussion on public and farming impacts of the event routes, among other details.

This memorandum provides a summary of Mr. Buchal's comments highlighted in blue along with our response, specific to Points IV, V and VI in his memorandum.

RESPONSE TO COMMENTS

Comment #1: The TIA confirms that no CUP can be granted – the new request to install multiple permanent graveled, culverted access roads to control traffic (and comply with the Oregon Health Authority regulations) clearly requires land use approval that cannot be granted as a matter of law.

Response: The Revised TIA does *not* confirm Mr. Buchal's conclusion that no CUP can be granted. WCMF is not requesting to install permanent roads or culverts. For additional clarification on proposed temporary graveled driveways and culverts, see information provided in response to Comments 11 through 13 of this memorandum. No changes to the traffic study were made in response to this comment.

Comment #2: We request attendance data from past festivals in the appendix to review for consistency with the evidence already of record.

Response: Additional information is included in the Revised TIA in Attachment 6, Ticket Information. This information was previously submitted in the February 20, 2018 TIA. No changes to the traffic study were made in response to this comment.

Comment #3: The peak times reported (page 45, TIA dated February 20, 2018) are inconsistent with the times of peak queue lengths reported in Linn County.

Response: As stated in the TIA, the arrival patterns within a specific day vary based on the day of the week and the popularity of the performer and time of the performance. The automated information from Frontgate was not considered to fully reflect the event characteristics (i.e., it does not reflect vehicle types or travel characteristics outside of the venue) and so was supplemented with information from the event traffic management team to better match field conditions. These trends are expected to vary annually as the performances will also vary from year to year. Based on additional discussions with Marion County staff and ODOT staff it was agreed that the Thursday ingress and Saturday egress do reflect the most critical event time periods. Further discussion is provided within the Revised TIA. No changes to the TIA were made in response to this comment.

Comment #4: With respect to Step 4, the Traffic Demand Analysis, we are concerned that much of the data used to estimate baseline traffic is more than five years old. The projected 2% growth rate does not seem adequate or based on evidence. One would expect the January 2018 counts to be lower than summer counts, and that they are in many cases not lower, or not much lower, seems to indicate that the summer counts should be higher.

The TIA collected new counts in January 2018 and used this as a basis of comparison to the historical data provided by Marion County. This historical data provided by Marion County was collected in the summer (and was collected at various locations between 2012 and 2016) and better reflects conditions at the time the event will occur. Comparison of the 2018 counts to this historical data showed little difference in traffic volumes. This is not indicative of area growth but appropriately reflects that agricultural uses do not generate significant traffic volumes.

As stated in the Revised TIA, the projected 2% growth rate (which is different from a seasonal adjustment) was based on the projected traffic demand from Marion County's Rural Transportation System Plan and confirmation with the County's Traffic Engineer, Julia Uravich. The Transportation System Plan is a 20-year planning document adopted by the County. It states that future traffic volumes are based on many factors, but primarily involve zoning and anticipated employment and population growth, both of which show reflect very low growth in the surrounding area.

As the TIA assumptions and methodology were confirmed with ODOT staff and Marion County staff within the scoping materials that were submitted prior to preparation of the TIA no changes to the TIA were made in response to this comment.

Comment #5: Peak hour factors of 0.95 and 1.0 also do not appear to be based on evidence.

Response: Peak Hour Factors (PHF) reflect how constant or variable traffic volumes are over the study hour analyzed. In cases where traffic volumes are constant throughout an hour (steady traffic flows), the PHF is 1.0. Highly variable traffic flows (such as at a school that has a short-duration peak) will experience lower PHFs. The TIA analyzes the peak ingress and egress hour of the event; during these periods traffic flows on the system are steady and elevated.

On page 71 of the Revised TIA, we explain that a PHF of 1.0 was applied to the intersections along the primary egress route during the event departure peak hour as it is expected that there will be a constant flow of traffic through these intersections during the peak hour. As stated within the TIA, the event will require approximately two hours to completely clear, so the steady flow rates are appropriate. During other time periods (such as event ingress), a PHF of 0.95 is appropriate along these primary routes as

traffic volumes will be nearly constant and elevated. Lower PHFs were applied to County roads west of the site to account for more dispersed traffic conditions in the lower-volume areas. Documentation of these analysis calibration factors is provided within the report and technical appendices.

Since the TIA assumptions and methodology were confirmed with ODOT staff and Marion County staff within the scoping materials that were submitted prior to preparation of the formal traffic study no changes to the TIA were made in response to this comment.

Comment #6: The model runs using Synchro 10 analysis software are not documented well enough to understand the conclusions presented, with numerous unexplained acronyms. Numerous adjustments were made to the actual data that are poorly described (page 55, TIA dated February 20, 2018). The seasonal adjustment factors contained in Attachment 4 contain no legend and are incomprehensible.

Response: Synchro 10 is a macroscopic analysis tool used in this report for the analysis of the intersections using the *Highway Capacity Manual 6th Edition* methodology. There are numerous steps in evaluating the operations of intersections and it would not be appropriate for the basic terms and concepts to be included within the TIA. There were several adjustments applied to the modeling to calibrate the models for the WCMF. This included calibrations to the proportions of recreational vehicles within the Thursday arrival patterns, calibrations to PHFs as previously described, and application of seasonal adjustments per the ODOT Analysis Procedures Manual which is an inherently technical process. It is important to note that Marion County and ODOT traffic engineers are familiar with the traffic analysis tools and understand how they are applied. Technical staff from these agencies have reviewed the TIA and scoping materials that outlined these analysis methodologies and assumptions that were provided in compliance with standard industry practice.

The seasonal adjustment worksheets cited by the opponents provide only the relevant pages that were provided to our team from ODOT's traffic management staff that oversee the Automatic Traffic Recorders (ATR), which inadvertently removed the headers. The full ATR data file provided by ODOT staff is included as an attachment to this document to supplement the relevant sections provided within the original appendices. As the study assumptions and methodology were confirmed with ODOT and Marion County staff within the scoping materials that were submitted prior to preparation of the formal traffic study no changes to the traffic study were made in response to this comment.

Comment #7: We have concerns with some of the statements in the TIA. For example, it is reported both that county roads have plenty of excess capacity but also that congestion would be so severe that adverse impacts arising from numerous larger vehicles may be disregarded (page 57, TIA dated February 20, 2018). Adjustments made to the I-5 modeling are again poorly described (page 59, TIA dated February 19, 2018). We particularly question the use of 0% heavy vehicles in many I-5 runs (e.g., Attachment 5, Synchro 10 Report, page 2 in TIA dated February 20, 2018)

Response: The comment above confuses separate statements from different sections of the February 20, 2018 TIA. The first is that "area roads experience very low volumes, and field review shows that all of the area intersections currently operate well within agency performance standards today" (Page 71 in the Revised TIA, April 6, 2018). This statement reflects current operational conditions without the Festival traffic and is included within the *existing conditions* section of the TIA.

The second piece of this comment regarding the larger vehicle impact is related to the section on determining roadway capacity, or the maximum number of vehicles that can be served, on the county roads. This was determined by using the procedures in the *Highway Capacity Manual 2010* for Class II Two-Lane Highways. As stated in the TIA, the level of service and capacity of Class II Two-Lane Highways

are based on the percent time spent following. Normally a heavy vehicle traveling more slowly causes the passenger cars behind it to go below their desired travel speed until the passenger cars can find a gap and pass. In these instances, heavy vehicles have an impact on the roadway operations. When the roadway is at capacity, all vehicles are traveling slowly and at a similar and decreased speed due to the overall volume and are not additionally impacted by the heavy vehicles which are able to maintain the prevailing speed. Therefore, when looking at the capacity of the roadway, the number of heavy vehicles does not have an additional impact. The TIA looked at the roadway capacity to determine how much traffic volume the area roadways would be able to accommodate per hour.

The heavy volume percentages used in the intersection analysis as reported in the Synchro 10 Existing Conditions Level of Service Reports reflect the recorded turning movement volumes from January 17, 2018. This shows that at certain I-5 ramp terminals there were no heavy vehicles identified within the traffic counts. This is not indicative of I-5 mainline volumes or characteristics but reflect commute-hour volumes on low-volume adjacent County roads. Traffic counts provided by a non-affiliated third-party data collection firm are provided within the appendices and include peak hour data on heavy vehicles, cyclists, and pedestrians.

As the analysis was prepared consistent with ODOT and Marion County analysis procedures no changes to the traffic study were made in response to this comment. It is important to note that Marion County and ODOT traffic engineers are familiar with the traffic analysis tools and analysis procedures.

Comment #8: Inasmuch as I-5 is already jammed and operating over capacity on at least one day (page 62, TIA dated February 20, 2018), the incremental impact of the Festival cannot help but be enormous. There needs to be a narrative discussion of the meaning of such arcane facts as a 145.5 value for “Int. Delay, s/veh” (Attachment 5, Synchro 10 Report p. 6). The notion that on local roads, at peak times, “traffic will be traveling at 15-20 mph and local traffic will have a right of way to enter” is absurd and should call into question the fairness of the analysis.

Response: The February 20, 2018 TIA and the Revised TIA both show that I-5 is currently operating at 70-80% of its carrying capacity during its peak times during the evening weekday commute and the noon hour on the weekends. The base volume used in the existing analysis already includes traffic from the Portland and Salem areas traveling to and from the 2016 Brownsville event. To be conservative, the trip generation from the Festival was added on top of these numbers, essentially accounting for simultaneous festivals in Brownsville and at Ankeny Hill. With these conservative assumptions the analysis shows that the system is forecast to operate below its carrying capacity except for an hour during the Friday evening commute hour in the southbound direction heading toward the event. Whether or not this occurs also depends on upstream conditions on the I-5 corridor (particularly within the metro areas), but ultimately influences the management strategies employed.

The “Int. Delay, s/veh” value reported is from the Synchro 10 analysis worksheets. It reflects the conditions if the Festival were to occur with no mitigation as the existing traffic control (largely comprised of STOP signs) is not set to accommodate the directional flows proposed with the event. The section titled, *Step 6. Traffic Mitigation Plan*, in the TIA discusses the recommendations and specific flagging strategies to address safety, delays, and farming, wildlife refuge and business operations.

The quote that “traffic will be traveling at 15-20 mph and local traffic will have a right-of-way to enter the queue” refers to vehicles on Talbot Road. The Festival traffic heading to and from the site will be on specific routes identified in Figures 1 through 3 in the Revised TIA. Motorists exiting the Festival to the south will travel via Jorgenson Road, then required to stop at the intersection with Talbot Road and required to wait on Jorgenson Road for an opening in the traffic stream before entering Talbot Road. In

addition, these routes utilize a small portion of Talbot Road between the venue and the interchange. Flaggers will be located on Talbot Road at the driveway to the Festival venue, at the Jorgenson Road/Talbot Road intersection, and at three locations at the Talbot interchange. These flaggers will be able to prioritize serving local traffic who will have the right-of-way over traffic turning left from an event driveway. No changes to the TIA were made in response to this comment.

Comment #9: We question the absence of a queueing analysis and we don't see a Synchro analysis of conditions after mitigation.

Response: The queueing analysis is presented within the appendices ("HCM 95th %tile Q(veh)") for existing and the unmitigated event conditions. This shows that without mitigation there would be substantial queueing throughout the study area as the current stop-sign control would be stopping traffic along the primary event routes. The mitigated traffic control strategy replaces these stop signs with flagging staff that will actively be managing queueing on the system. Essentially, traffic into the festival will travel without encountering any stop signs and will be part of a traffic flow into an event.

The only location that queues will form with this type of traffic control strategy is where vehicles enter the festival driveways, as these provide a lower carrying capacity than the County roads. The plan incorporates multiple driveway locations to address this, by essentially providing more ingress capacity into the event than is provided by the County roads.

Conversations with ODOT staff and Marion County staff required the applicant to develop contingency routes in order to plan for unforeseen incidents or emergencies. The required addition of the contingency routes provides this additional queue storage distance (7 to 8 miles) to prevent back-ups onto the I-5 mainline. This setup also provides the additional benefit of having increased flexibility to address the movement of over-width equipment should it be necessary.

Overall, traffic flows and queueing will be actively managed throughout the event peaks with certified flaggers to manage queueing at critical points within the transportation system. As a result, no changes to the TIA have been made in response to this comment.

Comment #10: No specific questions related to the TIA were ever posed to my client and the traffic consultants ignored the material already provided and of record.

Response: The traffic consultants reviewed all written and oral materials presented to the County, prior to, and during the Marion County Hearing for the proposed Willamette County Music Festival (WCMF), on December 20, 2017. With the exception of opponents represented by legal counsel, letters were sent to all stakeholders that had submitted comments as part of the October 26, 2017 letter to Marion County, requesting the opportunity to meet and more fully understand the nature of the farming and business practices, use and movement of the equipment on the county roads. Legal counsel for the WCMF made several attempts to coordinate with the legal counsel for other opponents though they were unwilling to meet.

Three of the area stakeholders were willing to meet with the traffic consultants prior to the February 20, 2018 TIA submittal, with an additional meeting prior to the April 6, 2018 Revised TIA submittal. Information gained from these meetings was used to better understand the equipment characteristics, farming practices, and in developing mitigation measures to reduce potential impacts to area farms and businesses.

A considerable amount of written and oral testimony submitted into the record related to the Music Festival that has been held in Brownsville over the past 9 years. While not all of the traffic impacts at the Brownsville event are directly applicable to the proposed WCMF in Marion County, lessons learned from past events and conversations and review of written materials from Linn County, Jackson County and ODOT staff helped shape the recommended traffic mitigation strategies proposed to support the relocation of the WCMF to Marion County.

As extensive outreach efforts were provided by the WCMF team to understand area farming and business practices in the area (including within the open record submittal) no further changes to the TIA were provided in response to this comment.

Comment #11: The TIA states (page 64, TIA dated February 19, 2018) that numerous new roads must be built to get attendees off the county roads more quickly. Covering EFU farmland with gravel and culverts is not a “temporary” development; it is intended to provide permanent facilities that will be used on an annual basis. No details concerning 12-15 roads have been provided.

Response: The Revised TIA clarifies under item 9 that all new temporary driveways “will require approval and permits from Marion County Land Use Engineering and Permits” and “all temporary driveways are required to be restored to previous conditions following the event.” The restoration of the temporary driveways to previous conditions is a condition of the temporary access permit.

The TIA states the need for 12-15 driveways to adequately serve the demand for the event and expedite the removal of vehicles from county roads during the ingress to the event. Additional information on temporary driveways follows below; graveled entrances will not extend into the adjacent field, rather only far enough to provide adequate cover over the temporary culverts. Roadways to serve the camping and parking areas on the fields will not be gravel, rather, marked roadway alignments across the field.

Since the comment incorrectly describes the proposed access routes no changes were made to the TIA in response to this comment.

Comment #12: Approval of the proposed transportation mitigation may subject Marion County to liability for taking federally protected endangered species. Sydney Power Ditch is specifically listed as Essential Salmon Habitat (ESH) under Oregon law. Among the species that utilize the Ditch are Upper Willamette River Steelhead, which are listed as “threatened” under the federal Endangered Species Act. The Upper Willamette River Conservation and Recovery Plan for Chinook Salmon and Steelhead specifically identifies threats to these listed steelhead from access problems, including culverts and the Sidney Ditch.

The Ditch is also included in habitat designated as “critical” for listed steelhead. See 65 Fed. Reg. 7764, 7779 (Feb. 16, 2000) (Critical habitat is designated to include all river reaches accessible to listed steelhead in the Willamette River and its tributaries above Willamette Falls upstream to, and including, the Calapooia River”); see also 70 Fed. Reg. 52,630 (Sept. 2, 2005)). Federal law prohibits any adverse modification of such “critical habitat”. For this reason, area farmers have been required to screen any diversions from the Ditch.

Response: Based on our review, it is understood that the Sidney Power Ditch does not flow along the north side of Talbot Road, rather, it is a year-round waterway that flows northwesterly from the east side of I-5, then under I-5, and under an existing bridge on Wintel Road, then flows parallel and approximately 670-feet north of Wintel Road in the vicinity of the proposed Festival. The attached map labels the Sidney Power Ditch and highlights its location.

The proposed music stage and performances will occur on the north side of the Sidney Power Ditch and all camping, ADA parking and General Parking will be located on the south side of the Sidney Power Ditch. Presently, there is one clear span pedestrian bridge across the Sidney Power Ditch, approximately 1,900-feet west of the Wintel Road bridge across the Ditch. The existing clear span pedestrian bridge does not touch any portion of the water in the Ditch. It is proposed that an additional clear span pedestrian bridge will be installed for the Festival. The clear span structure will not touch any portion of the water in the Ditch and not impact the water flow or fish habitat. The additional pedestrian bridge will be located approximately 600-feet west of the Wintel Road Bridge. (See attached map of the proposed Festival Event Layout). No culvert and/or gravel driveway is proposed to be constructed or installed on or within the Sidney Power Ditch as part of the proposed Festival.

It is further understood that “Chehulpum Creek”, (rather than the Sidney Power Ditch cited within the comments) flows westerly along the north side of Talbot Road. Chehulpum Creek crosses under the I-5/Talbot Road interchange, then flows westerly on the north side of Talbot Road for approximately 3,050-feet west of Jorgenson Road. An existing bridge on Talbot Road at this location allows Chehulpum Creek to flow south under Talbot Road and continues in a southwesterly direction. An existing driveway on the north side of Talbot Road is located approximately 100-feet to the west of the bridge, beyond Chehulpum Creek. It is proposed that the existing driveway will serve to provide access to Section D Camping area. No new or temporary culverts and/or driveways are proposed or requested to cross Chehulpum Creek as part of the proposed Festival (See attached map).

The attached map also identifies a winter-time drainage ditch that bisects Section C and Section B. It is understood that this drainage ditch is dry throughout the summer. For locations of the proposed temporary driveways see also – Figure 5, Page 10 “*Preliminary Event Layout*” and Figure 50, Page 67 “*Preliminary WCMF Camping and Parking Layout*” of the Revised TIA.

As no culverts and/or gravel driveways are proposed to be constructed or installed on or within the Sidney Power Ditch or Chehulpum Creek as part of the proposed Festival no changes were made to the TIA in response to this comment. Additional clarification of the driveway location and waterways is provided within the attached map.

Comment #13: If Marion County approves the adverse modification of such critical habitat by the installation of numerous culverts and gravelling, the County is potentially liable for the “take” of listed species. See *generally* 16 U.S.C. § 1538(a)(1) (prohibiting “take”). The federal fish and wildlife agencies have issued guidance to provide clear notification to the public that habitat modification or degradation may harm listed species and, therefore, constitutes a take under the ESA. See *generally* 64 Fed. Reg. 60,727 (Nov. 8, 1999); 50 C.F.R. § 222.102 (“take” defined to include “harm”; definition of “harm”). Where, as here, designated critical habitat is involved, its adverse modification by installing numerous culverts is highly likely to constitute an illegal take.

Response: As discussed above, no culvert and/or gravel driveway is proposed to be constructed or installed on, or within the Sidney Power Ditch as part of the proposed Festival. No culvert and/or gravel driveway is proposed to be constructed across the Chehulpum Creek as part of the proposed Festival.

Temporary driveways will be requested to serve the camping areas, ADA parking, premier parking and general parking lots as part of the Festival. The proposed driveways will be located on Jorgenson Road and Wintel Road across dry ditches, into dry fields. It is understood that Marion County will require that temporary culverts be installed immediately adjacent to, and parallel to the public county road in tandem with the proposed temporary driveways. The purpose of the temporary culverts is not to accommodate existing open water channels, but rather to manage ground water in the case of a major rain event during the Festival. Graveled entrances will not extend into the adjacent field, rather only far enough to provide adequate cover over the temporary culverts. Roadways to serve the camping and parking areas on the fields will not be gravel, rather, marked roadway alignments across the field. It is anticipated that the construction of all of the temporary culverts and driveways will occur over two to three days and will be in place immediately prior to the event and removed following the event, with the area restored to pre-festival conditions. Also see Item 9 on Pages 83 and 84 of the Revised TIA. As no graveled roadways will be constructed across the fields, no removal of roadways will be required.

Please note that Figure 1 on Page 5 *“Proposed Primary Ingress Routes”* and Figure 44 on Page 59 *“I-5 Southbound Ingress Primary & Contingency Routes”* are not intended to identify specific locations of temporary driveways to serve the Festival, rather these figures are intended to provide general major travel routes to the event. The attached map further clarifies the proposed access locations and shows that these locations avoid impacts to waterways. No additional changes to the TIA were made in response to this comment.

NEXT STEPS

I trust that these materials provide an adequate response and appropriate clarity to the submitted transportation comments. If you have any questions or comments please contact me at (503) 997-4473 or at joe@transightconsulting.com.

An aerial photograph of a golf course. The central feature is a red-colored fairway or green area, which is the focus of the image. To the left of this red area is a large green grassy field. To the right is a body of blue water. The background shows a sandy area with various structures, including white tents, trailers, and a large building with a sign that says 'PGA'. The text 'VIP' is overlaid in white, 'PGA' in black, and 'GA' in black.
